## Among Cirrhotic Patients with a Hepatitis C Sustained Viral Response, the Risk of De-Novo Hepatocellular Carcinoma Relates to Baseline Factors and Not the Use of Direct Acting Antivirals: Results from a Nationwide Cohort

Hamish Innes, Stephen T. Barclay, Peter C. Hayes, Andrew Fraser, John F. Dillon, Adrian Stanley, Andy Bathgate, Scott McDonald, David Goldberg, Heather Valerio, Ray Fox, Nick Kennedy, Pete Bramley, Sharon J. Hutchinson

Abstract PS-035

## De-Novo HCC Risk Post-SVR Study: Background

| Author        | Journal         | Recurrence or occurrence? | Country, setting                | Sample   | Frequency of HCC occurrence/recurrence                   | Control group |
|---------------|-----------------|---------------------------|---------------------------------|--|--|---------------|
| Reig et al    | J Hepatol, 2016 | Recurrence                | 4 referral hospitals, Spain     | Treated with IFN-free regimen after successfully treated HCC, N=59 | 28% after median follow-up of 5.7 months                 | None          |
| Conti et al   | J Hepatol, 2016 | Recurrence                | Liver clinics in Bologna, Italy | Treated with IFN-free regimen after successfully treated HCC, N=58 | 29% by 24 weeks post-treatment follow-up                 | None          |
| Conti et al   | J Hepatol, 2016 | Occurrence                | Liver clinics in Bologna, Italy | Cirrhotic patients treated with IFN-free therapy, N=285            | 3.2% HCC occurrence by 24 weeks post treatment follow-up | None          |
| Cardoso et al | J Hepatol, 2016 | Occurrence                | One clinic in Portugal          | Cirrhotic patients achieving SVR via IFN-free therapy, N=54        | 7.4% after median 12 months follow-up                    | None          |

Innes H, et al. 52nd EASL; Amsterdam, Netherlands; April 19-23, 2017. Abst. PS-035.

## De-Novo HCC Risk Post-SVR Study: Methods

- Retrospective cohort study using
  - Scottish HCV clinical database (downloads @ April 2016)
  - Subsequent medical chart review (carried out February-March 2017)
- Definition of study cohort
  - Inclusion criteria
    - SVR attainment in 1997-2016
    - Liver cirrhosis at time of starting treatment
  - Exclusion criteria
    - Diagnosis of HCC prior to treatment
    - HBV/HIV co-infection
    - Attendance at a clinic with incomplete database or otherwise not able to participate in medical chart review
- Primary outcome event: first time diagnosis of HCC by cross-sectional imaging or biopsy
- Wide range of baseline patient characteristics extracted:
  - Age; gender ethnicity; postcode deprivation score; Child Pugh score; thrombocytopenia; alphafetoprotein; diabetes; alcohol history; smoking history; drug use history; prior genotype; clinic attended; number of prior treatment failures
- Survival analysis approach adopted
  - Start time = commencement of treatment
  - Stop time = earlier of: HCC occurrence; death; or reaching 31 Jan 2017
  - Used Cox regression to assess univariate and multivariate association between regimen (IFN-free vs. IFN-containing) and HCC

Innes H, et al. 52nd EASL; Amsterdam, Netherlands; April 19-23, 2017. Abst. PS-035.

## De-Novo HCC Risk Post-SVR Study: Results - Baseline Description of the Cohort (N=857)

| Characteristic    |  | % of cohort (N=857)   |
|-------------------|--|-----------------------|
| Demographics      | Average age                                | Mean: 49 years (sd:8) |
|                   | White ethnicity                            | 92%                   |
|                   | Male gender                                | 75%                   |
| Health Behaviours | History or heavy alcohol use               | 44%                   |
|                   | Current tobacco smoker                     | 73%                   |
|                   | History of intravenous drug use            | 70%                   |
| Clinical          | Thrombocytopenia (<100/10 <sup>9</sup> /L) | 28%                   |
|                   | Child Pugh B/C                             | 15%                   |
|                   | Diabetes                                   | 9%                    |
| Treatment         | Treatment experienced                      | 35%                   |
|                   | IFN-free regimen                           | 32%                   |

Innes H, et al. 52nd EASL, Amsterdam, Netherlands, April 19-23, 2017. Abst. PS-035.

## De-Novo HCC Risk Post-SVR Study: IFN-Containing Patients vs. IFN-free Patients

| Characteristic                                    | REGIMEN                   |                     | P-value |
|---|---------------------------|---------------------|---------|
|   | IFN-containing<br>(N=585) | IFN-free<br>(N=272) |         |
| Mean age  | 48.1 years                | 52.1 years          | <0.001  |
| Thrombocytopenic<br>(<100 per 10 <sup>9</sup> /L) | 22%                       | 39%                 | <0.001  |
| Child Pugh B or C                                 | 9%                        | 30%                 | <0.001  |
| Number of prior<br>failed treatment<br>episodes   | 0                         | 48%                 | <0.001  |
|   | 1                         | 35%                 |         |
|   | ≥2                        | 17%                 |         |

Innes H, et al. 52nd EASL, Amsterdam, Netherlands, April 19-23, 2017. Abst. PS-035.

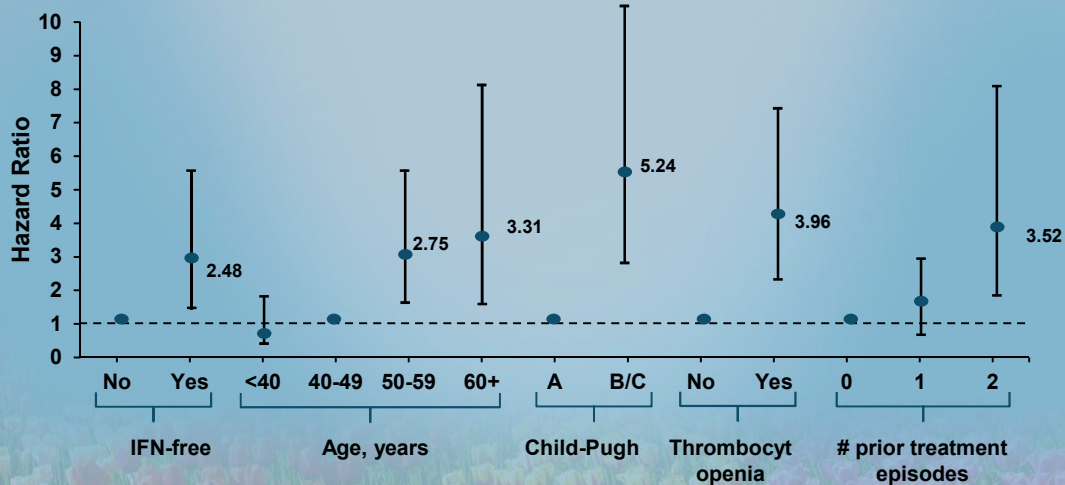

## De-Novo HCC Risk Post-SVR Study: Follow-up Time and Outcomes Events

|   |  | REGIMEN                   |                     |
|---|--|---------------------------|---------------------|
|   |  | IFN-containing<br>(N=585) | IFN-free<br>(N=272) |
| Follow-up, person years                 | Total  | 2697                      | 475                 |
|   | Median per patient (IQR)                     | 3.5 (2.2-5.6)             | 1.7 (1.4-2.0)       |
| Outcome events<br>(i.e. HCC occurrence) | Total #                                      | 34                        | 12                  |
|   | # occurring<br><24 weeks post-treatment      | 6                         | 5                   |
|   | # occurring<br>≥24 weeks post-treatment      | 28                        | 7                   |
|   | Median time to even<br>(min-max range)       | 2.5 yrs (0.3-8.5)         | 0.9 yrs (0.5-2.0)   |
|   | <b>Crude rate,<br/>per 100 persons years</b> | <b>1.26</b>               | <b>2.52</b>         |

Innes H, et al. 52nd EASL, Amsterdam, Netherlands, April 19-23, 2017. Abst. PS-035.

## De-Novo HCC Risk Post-SVR Study: Patient Characteristics

Patient Characteristics Associated with HCC Occurrence in Univariate Analysis

Innes H, et al. 52nd EASL, Amsterdam, Netherlands, April 19-23, 2017. Abst. PS-035.

## De-Novo HCC Risk Post-SVR Study: Results

Association Between IFN-Free versus IFN-containing Therapy and HCC Occurrence, in Univariate and Multivariate Analysis

\*Multivariate analysis includes adjustment for: age, gender, ethnicity, Child Pugh score, thrombocytopenia, alfafetoprotein, genotype, treatment experience and clinic location

Innes H, et al. 52nd EASL; Amsterdam, Netherlands; April 19-23, 2017. Abst. PS-035.

## De-Novo HCC Risk Post-SVR Study: Conclusions

- There is no evidence that IFN-free therapy increases the risk of HCC occurrence in patients achieving an SVR
- Baseline characteristics of patients treated with IFN-free regimens differ from those treated with IFN-containing regimens
- Multivariate analysis demonstrated that the risk of HCC occurrence was equivalent between these two groups of patients

Innes H, et al. 52nd EASL; Amsterdam, Netherlands; April 19-23, 2017. Abst. PS-035.
